

## **ABSTRACT**

We use to manually switch on or off the light and fan in our homes, offices or any other building. And so this has been so hard for the disabled people to do such kind of activities, but recently there had been a project that enable us to switch on or off the light by using a remote control. But this is a bit limited as people can only switch on and off the light by using a remote control.

The aim of this project is to enable the disabled people to have the ability to switch on or off the light or fan by using a remote control.

The exercise of Literature review was followed with data collection and analysis which helped in implementing this project by adding another appliance (fan) and connect them together so that they could be using the same remote control.
